Because `len++` is "do it first and then add it", the BUG version first judges whether `src[len++]` is 1, that is, when `\0` is not detected, `len` goes to `+1`, but this will cause the problem of adding 1 more to `len`. So the FIX version is to solve this problem. In the FIX version, `len++` becomes `++len`, that is to say, it becomes "add first and then do it", `len +1` first, and then to determine whether there is `\0`, if so, then Stop the loop, so the result will be the correct value.
